About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

Useful links:

IEC publications search - www.iec.ch/searchpub

The advanced search enables you to find IEC publications by a variety of criteria (reference number, text, technical committee,…).
It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available on-line and also once a month by email.
Electropedia - www.electropedia.org

The world's leading online dictionary of electronic and electrical terms containing more than 30 000 terms and definitions in English and French, with equivalent terms in additional languages. Also known as the International Electrotechnical Vocabulary (IEV) on-line.

Customer Service Centre - webstore.iec.ch/csc

Question

What are the requirements of IEC 60601-1:2005+A1:2012 for testing power supplies for ME Equipment?

Decision

CBTLs shall perform all applicable tests. If there are Certification considerations such as degree of insulation and application of risk management and omissions, it should be indicated on the CB certificate under "additional information" as "considerations are stated in the Test Report Form (TRF)". For the risk management application see also OD-2055.

Examples of considerations:

MOOP; MOPP; BF; CF; altitude; ambient temperature, number of fuses; etc.

Explanatory notes

There are a lot of power supplies available on the market, which are now tested and approved according to IEC 60601-1. Most of these power supplies are not completely tested to all applicable clauses. In most cases neither an instruction leaflet (user manual) nor other applicable tests (e.g. leakage current measurements) were conducted. This sometimes creates significant problems to the manufacturers of ME Equipment. Most manufacturers purchase such power supplies without noting that these power supplies are not suitable for the use in their products (e.g. MOPP is needed instead of MOOP or possibility of direct patient contact, etc…), due to the lack of information provided by the CB test certificate or the absence of instructions for use.

In many cases the manufacturer of the end MEE has to change his product significantly. Sometimes double testing has to be performed.

For the special case of desktop type power supplies or non-build-in power supplies, for most of above mentioned cases, no risk management according to ISO 14971 is evaluated. However, desktop type power supplies or non-build-in power supplies are most often not build-in into the equipment, and therefore cannot be covered by risk analysis of the end manufacturer of ME Equipment.
