COLLECTION OF CTL DECISIONS

Standard: IEC 61010-1:1990 +A1:1992+A2:1995	**Sub clause:** 6.5.3	**Sheet n. 300** **Page 1(1)**
Subject: Protective Impedance	**Key words:** - Shock - Impedance - Protective	**Decision taken by ETF3 and confirmed by CTL at its 38th meeting, in Toronto**

Question:

Where a component acts as protective impedance in single fault condition, should it be rated for this function? An example is a component in an accessible secondary circuit which may be made hazardous live by the failure of a creepage or clearance distance.

Decision:

Such components should be rated for the single fault condition.

Explanation:

The safety of the user will be dependent on the operation of these devices. It will, however, be preferable for the design to avoid this circumstance as the integrity of the components is not defined.
