COLLECTION OF CTL DECISIONS

Standard:	**Sub clause:**	**Sheet n. 344**
IEC 61010-1:1990 +A1:1992 + A2 :1995	4.4.2.4	**Page 1(1)**
Subject:	**Key words:**	**Decision taken by ETF3 and confirmed by CTL at its 38th meeting, in Toronto**
Motors	- Locked rotor - Stopping rotor	

Question:

How do Test Houses perform these tests, in particular when motors are operating at high speed?

Decision:
It was agreed that the following tests are required;

1. Locking the rotor when stationary and

2. Stopping the rotor when at full speed. This does not necessarily imply an instantaneous cessation of movement and a gradual slowing may be appropriate, for example, seizing of bearings.

Explanatory Notes:

The tests need not be performed if a risk analysis indicates that no hazard could arise.

The test of the motor is performed with all mechanisms attached and moving parts in operation.
