COLLECTION OF CTL DECISIONS

Standard:	**Sub clause:**	**Sheet n. 359**
IEC 61010-1:1990 +A1:1992 + A2 :1995	14.7	**Page 1(1)**
Subject:	**Key words:**	**Decision taken by ETF3 and confirmed by CTL at its 38th meeting, in Toronto**
Mains transformers	- Overload - Temperature limits	

Question:

1. What temperature limits are used?
2. The test specifies that the protective device is left in circuit but this will render the test impractical if the device is a fuse, which may rupture in less than 1 hour. So how do laboratories perform this test?
3. "Directly Connected" can be seen as in many ways, can the laboratories share their practice?

Decision:

It was agreed that;

1.Table 4 'Motor temperatures' should be referenced.
2. The test circuit should be arranged such that the test can continue for 1 hour.
3.The fuse should be connected such that no single fault condition between the transformer and the fuse should cause a hazard.

Explanatory Notes:
