COLLECTION OF CTL DECISIONS

Decision

Standard: IEC60950, 2nd Edition	**Sub clause:** 4.4.3	**Sheet n.** 385 **Page** 1 (1)
Subject: Flammability of materials and components	**Key words:** -Fire enclosure -Flammability	**Decision confirmed at CTL 38th meeting**

Question:

It is allowed to add decorative parts with flammability class HB to the outside of the fire enclosure of, for example, a computer. Consider the situation that the computer is, then, installed inside the fire enclosure of bigger equipment. According to the standard, parts inside a fire enclosure of the bigger equipment must meet the requirements of clauses 4.4.3.2 and 4.4.3.3: all materials inside a fire enclosure must be of flammability class min V-2 or HF-2. It is not clear whether the decorative HB material on the outside of the computer is exempted from this requirement since the computer has been approved separately

Decision:

HB material inside a fire enclosure is not allowed, reference clause 4.7.3.4 in the 3rd ed.
